IN THE CLAIMS

Please cancel claims 1-12, 16, 20-26, 28-30, 34, 35, and 38 without prejudice to their prosecution in related applications.

Please amend claims 17-19, and 27 as shown below.

The pending claims are believed to be as follows:

- 1-16. (Cancelled)
- 17. (Currently Amended) The method of claim 16 27 wherein said natural tissue comprises a biological tissue or a matrix derived from a biological tissue.
- 18. (Currently Amended) The method of claim 16 27 wherein said natural tissue comprises pericardium tissue.
- 19. (Currently Amended) The method of claim 16 27 wherein said natural tissue comprises small intestine submucosa.
 - 20-26. (Cancelled)
- 27. (Presently Amended) The method of claim 16 wherein said intervertebral disc device comprises braided natural tissue A method of augmenting the nucleus of an intervertebral disc, said method comprising the steps of:
- (a) implanting in the intervertebral disc an intervertebral disc device comprising a length of braided natural tissue sized for introduction into an intervertebral disc nucleus space, wherein said length of natural tissue has a first, straightened configuration and a second, folded configuration, wherein said first, straightened configuration presents a first cross-sectional size and said second, folded configuration presents a second cross-sectional size, wherein said first cross-sectional size is smaller than said second cross-sectional size; wherein said device additionally comprises a drawstring effective for

folding said length of natural tissue to its second, folded configuration after implantation of the tissue in a disc nucleus space; and

- (b) pulling the drawstring to fold the length of natural tissue.
- 28-41. (Cancelled)
- 42. (Previously Amended) A device for augmenting, repairing or replacing an intervertebral disc nucleus, said device comprising: (a) a braided natural tissue implant having a first end and a second end; and (b) a drawstring secured near the first end of said braided tissue implant and passing through said implant at a multiplicity of sites from the first end to the second end; wherein said drawstring is effective for folding said braided natural tissue to a folded configuration after implantation of the tissue in a disc nucleus space;

wherein said implant defines a first, straightened configuration in which the implant has a length-to-width ratio of at least 5:1 when said drawstring has an effective length approximately equal to the length of the straightened natural tissue, and

wherein said implant defines a second, folded configuration in which the implant has a length-to-width ratio of less than 5:1 when said drawstring has an effective length less than the length of the straightened natural tissue,

- 43. (Original) The device of claim 42 wherein the natural tissue comprises braided pericardium tissue.
- 44. (Original) The device of claim 42 wherein the natural tissue comprises braided small intestine submucosa.

- 45. (Original) The device of claim 42 wherein said drawstring passes through the braided implant at a multiplicity of sites throughout the length of the implant, with said multiplicity being at least three sites.
- 46. (Original) The device of claim 45 wherein said drawstring passes through at least five sites.
- 47. (Original) The device of claim 46 wherein said drawstring passes through at least ten sites.
- 48. (Previously Amended) A method of augmenting, repairing or replacing an intervertebral disc nucleus, said method comprising:
- (a) providing a braided natural tissue implant having a first end, a second end, and a drawstring, wherein said drawstring is secured near the first end of said braided tissue implant and passes through the implant at a multiplicity of sites from the first end to the second end, and wherein said implant defines a first, straightened configuration in which the implant has a length-to-width ratio of at least 5:1 when said drawstring has an effective length approximately equal to the length of the straightened natural tissue;
 - (b) implanting said straightened implant into an intervertebral disc space; and
- (c) manipulating said drawstring to cause said braided tissue implant to assume a second, folded configuration in which the implant has a length-to-width ratio of less than 5:1, said causing being accomplished by reducing the effective length of said drawstring.
